

Creating your site

Project structure

```
my-docs/
├── docsforge.yml      # Site configuration
├── docs/              # Your documentation
│   ├── index.md
│   └── ...
└── site/              # Build output (auto-generated)
```

The docs/ directory

Every `.md` file becomes a page. Subdirectories become sections.

```
docs/
├── index.md
├── getting-started.md
├── guides/
│   ├── index.md
│   ├── install.md
│   └── configure.md
└── reference/
    ├── index.md
    └── api.md
```

The docsforge.yml file

Minimal config:

```
site_name: My Project
```

With navigation:

```
site_name: My Project

nav:
  - Home: index.md
  - Guides:
    - Installation: guides/install.md
    - Configuration: guides/configure.md
  - Reference: reference/index.md
```

Writing content

DocsForge supports **all** Material-flavored Markdown out of the box. No extension config needed.

Admonitions

```
!!! note "Note"
    This is a callout.

??? warning "Click to expand"
    This is collapsible.
```

Math

```
Inline:  $E = mc^2$ 

Display:

$$\sum_{i=1}^n x_i$$

```

Code blocks

```
```python
def hello():
 print("Hello")
```

```
Tables, task lists, footnotes, definition lists

All work without configuration. See [Reference](reference/index.md) for full
syntax.

Building

```bash
docsforge serve      # Dev server with live reload
docsforge build      # Production build to site/
```

Publishing

DocsForge builds static HTML. Deploy `site/` anywhere:

- **GitHub Pages:** See [publishing guide](#)
- **Netlify, Vercel:** Drag and drop `site/`

- **Your own server:** `rsync -av site/ server:/var/www/docs`
