

Features

DocsForge includes everything you need to write and publish documentation. No extra installs, no extra config.

Core Features

Zero Dependencies

`pip install docsforge` gets you the engine, Material theme, all plugins, all Markdown extensions, KaTeX math, Pygments highlighting, fonts, icons, and a service worker. Nothing else to install.

Zero Configuration

Start with a working site in seconds. 7 plugins and 31 Markdown extensions load automatically. Customize only what you need.

Light & Dark Mode

Automatic system preference detection with a manual toggle. Both modes are fully customizable with your brand colors.

Full-Text Search

Client-side search powered by Lunr.js. No external services, no backend required. Works offline.

Math Rendering

Write `$$...$$` and it renders with KaTeX. No CDN calls for readers, no `extra_javascript`, no configuration.

< > Syntax Highlighting

Code blocks render with Pygments colors at build time. Supports all major languages.

📐 TikZ Diagrams

Write TikZ diagrams directly in Markdown. Automatically compiled to SVG at build time. No LaTeX install needed.

📡 Blogging

Built-in blog plugin with authors, categories, tags, archives, pagination, and RSS feeds.

📶 Offline Support

Service worker caches all assets. Your documentation works without an internet connection.

Markdown Extensions

All enabled by default. No configuration needed.

Category	Extensions
Structure	<code>toc</code> , <code>tables</code> , <code>fenced_code</code> , <code>def_list</code> , <code>footnotes</code> , <code>md_in_html</code> , <code>meta</code>
Text	<code>admonition</code> , <code>abbr</code> , <code>attr_list</code> , <code>nl2br</code> , <code>sane_lists</code> , <code>wikilinks</code>
pymdownx	<code>arithmatex</code> , <code>betterem</code> , <code>caret</code> , <code>critic</code> , <code>details</code> , <code>emoji</code> , <code>escapeall</code> , <code>extra</code> , <code>fancylists</code> , <code>highlight</code> , <code>inlinehilite</code> , <code>keys</code> , <code>magiclink</code> , <code>mark</code> , <code>pathconverter</code> , <code>progressbar</code> , <code>quotes</code> , <code>saneheaders</code> , <code>smartsymbols</code> , <code>snippets</code> , <code>striphtml</code> , <code>superfences</code> , <code>tabbed</code> , <code>tasklist</code> , <code>tilde</code>

Plugins

All enabled by default. No `plugins:` config needed.

Plugin	What it does
<code>blog</code>	Bloggng with authors, categories, archives, pagination, RSS
<code>info</code>	Admonition callouts (note, tip, warning, danger)
<code>meta</code>	OpenGraph metadata
<code>minify</code>	Compress HTML/CSS/JS output
<code>privacy</code>	Self-host external assets (Google Fonts, CDN scripts)
<code>search</code>	Full-text search with Lunr.js
<code>tags</code>	Tag system with tag pages

PWA / Offline

Every built site includes a service worker that:

- **Caches HTML pages** — network-first, updates cache in background
- **Caches assets** — CSS, JS, fonts, images served from cache for speed
- **Versioned updates** — Each build generates a unique SW hash, forcing browser refresh
- **Auto cleanup** — Old caches purged when new version activates

Publishing

DocsForge builds static HTML. Deploy `site/` anywhere:

- **GitHub Pages** — [Ready-to-use workflow](#)
- **Netlify, Vercel** — Drag and drop
- **Your own server** — `rsync site/ server:/var/www/docs`
