

Getting started

DocsForge is a self-contained documentation engine. `pip install`, write Markdown, build.

Installation

```
pip install docsforge
```

Requires **Python 3.10+**.

Quick start

```
# Create a new project interactively
docsforge
cd my-docs

# Start the dev server
docsforge serve

# Build for production
docsforge build
```

What's inside

After running `docsforge` to create a project, your directory looks like this:

```
my-docs/
├── docsforge.yml    # Site configuration
├── docs/
│   └── index.md     # Homepage
└── site/           # Build output
```

Configuration

The smallest valid `docsforge.yml`:

```
site_name: My Project
```

That's it. All plugins, extensions, and theme settings use sensible defaults. Add configuration only when you need to customize.

Key defaults

Feature	Default
Theme	Material (built-in)
Plugins	search, tags, blog, info, meta, minify, privacy
Markdown extensions	31 total — all pymdownx + python-markdown
Math	KaTeX (vendored, <code>\$\$...\$\$</code> works)
Code highlighting	Pygments (colored syntax)
Dark mode	Light/dark toggle in header
Fonts	Self-hosted (privacy plugin downloads Google Fonts)
Diagrams	TikZ support (auto-compiled to SVG)
Offline	Service worker caches all assets

What's built in

Documentation

- Write Markdown with 31 extensions
- Admonitions, tabs, task lists, footnotes
- Mermaid and TikZ diagrams
- KaTeX math rendering
- Pygments code highlighting

Discovery

- Full-text search (Lunr.js)

- Tags and tag pages
- Navigation with sections and tabs
- Table of contents

Theming

- Material theme with light/dark mode
- Customizable colors and fonts
- 14,000+ icons (Material, FontAwesome, Octicons)

Blogging

- Author profiles
- Categories and tags
- Archive pages
- Pagination
- RSS feeds

Publishing

- Static HTML output
- GitHub Pages ready
- PWA with offline support
- Minified HTML/CSS/JS
