

Publishing Your Site

DocsForge builds static HTML that can be deployed to any web server or static hosting platform. This section covers everything you need to get your docs online.

Quick Deploy

The fastest ways to deploy:

Platform	Method	Time
GitHub Pages	GitHub Actions	5 min
Netlify	Drag <code>site/</code> folder	1 min
Render	Git push	2 min
Surge.sh	<code>surge site/</code>	30 sec

What's in This Section

- **Usage Guide** — Day-to-day DocsForge commands, configuration, and content features
- **Migration Guide** — Moving from MkDocs/Material to DocsForge, feature parity, step-by-step migration
- **Deployment Guide** — Detailed instructions for 12+ platforms: GitHub Pages, Netlify, Vercel, Cloudflare, Render, DigitalOcean, AWS, Firebase, Docker, and more

Build Output

DocsForge outputs a `site/` directory containing:

```
site/
├─ index.html      # Homepage
├─ 404.html        # Error page
├─ sitemap.xml     # SEO sitemap
├─ sitemap.xml.gz  # Compressed sitemap
├─ manifest.json   # PWA manifest
```

```
├── assets/                # CSS, JS, fonts, images
│   ├── javascripts/
│   ├── stylesheets/
│   └── ...
└── [your pages]/         # One HTML file per Markdown page
```

This is a static site — deploy it anywhere that serves HTML files.

One-Command Deploy Examples

GitHub Pages (with Actions)

See [Deployment Guide](#) → [GitHub Pages](#) for the full GitHub Actions workflow.

Netlify (Drag & Drop)

1. Run `docsforge build`
2. Go to netlify.com
3. Drag the `site/` folder onto the page

Surge.sh

```
npm install -g surge
docsforge build
surge site/ my-docs.surge.sh
```

Docker

```
docsforge build
docker run -v $(pwd)/site:/usr/share/nginx/html:ro -p 8080:80 nginx:alpine
```

Before You Deploy

Checklist

- ☐ `site_url` in `docsforge.yml` matches your actual domain
- ☐ `repo_url` set (for "Edit this page" links)
- ☐ `copyright` configured
- ☐ Build succeeds: `docsforge build`
- ☐ Site looks correct: `docsforge serve`

SEO Essentials

DocsForge handles these automatically:

-  Sitemap (`sitemap.xml.gz`)
-  PWA manifest (`manifest.json`)
-  OpenGraph tags (automatic)
-  Semantic HTML
-  Fast loading (optimized assets)
