

Formatting

DocsForge extends standard Markdown with additional inline formatting options for emphasis, technical notation, and special characters.

Highlight

Mark text with `==highlighted==` for emphasis:

```
This is ==highlighted text== for emphasis.
```

This is **highlighted text** for emphasis.

Use highlights to draw attention to key terms, warnings, or important notes within a paragraph.

Subscript

Use `~subscript~` for chemical formulas and mathematical notation:

```
H~2~0 is the chemical formula for water.
```

```
CO~2~ emissions are a major concern.
```

```
E = mc~2~ is Einstein's famous equation.
```

H₂O is the chemical formula for water.

CO₂ emissions are a major concern.

E = mc₂ is Einstein's famous equation.

Superscript

Use `^superscript^` for exponents and ordinal numbers:

```
The area of a circle is πr^2^.
```

```
x^2^ + y^2^ = z^2^
```

1st, 2nd, 3rd

The area of a circle is πr^2 .

$$x^2 + y^2 = z^2$$

1st, 2nd, 3rd

Inserted and deleted text

Use `++inserted++` and `~~deleted~~` for tracking changes:

This is ++new++ and this is ~~old~~.

The price is ~~\$50~~ ++\$45++.

This is ++new++ and this is ~~old~~.

The price is ~~50~~ + +45++.

Diff-like syntax

This is useful for showing changes in documentation, changelogs, or migration guides.

Keyboard keys

Use `++key++` syntax for keyboard shortcuts:

Press ++ctrl+alt+delete++ to restart.

Press ++cmd+shift+3++ to take a screenshot.

Press ++ctrl+s++ to save.

Press ++enter++ to confirm.

Press `⌘` + `⌥` + `⌫` to restart.

Press `⌘` + `⇧` + `3` to take a screenshot.

Press `⌘` + `S` to save.

Press `↵` to confirm.

Key combinations

Syntax	Renders as
<code>++ctrl+c++</code>	
<code>++ctrl+v++</code>	
<code>++ctrl+z++</code>	
<code>++cmd+tab++</code>	
<code>++alt+f4++</code>	
<code>++shift+delete++</code>	
<code>++enter++</code>	
<code>++escape++</code>	
<code>++space++</code>	

Mark (alias for highlight)

Use `==marked==` text (same as highlight):

```
==Important==: Read this section carefully.
```

Important: Read this section carefully.

Critic markup

Track changes in drafts with critic markup:

```
This is deleted and this is inserted.
```

```
This is changedto this.
```

This is ~~deleted~~ and this is inserted.

This is ~~changed~~to this.

Critic markup extension

Requires `pymdownx.critic` extension to be enabled. It is enabled by default in DocsForge.

Smart symbols

Type common symbols easily:

Input	Output	Input	Output
(c)	©	(tm)	™
(r)	®	1/2	½
1/4	¼	3/4	¾
+-	±	-->	→
<--	←	<->	↔
==>	⇒	<==	⇐
<=>	↔	...	...
--	—	---	—

```
(c) (tm) (r) 1/2 1/4 +- --> <-- ==> <== ...
```

© ™ ® ½ ¼ +- → ← **><** ...

HTML entities

Use any HTML entity directly in Markdown:

© ™ ® — – … ← → ↑ ↓

© ™ ® — … ← → ↑ ↓

Custom CSS classes

Apply CSS classes to inline elements:

```
[Text with class]{: .custom-class }

[Red text]{: .red }

[Large text]{: .lg }
```

Requires defining the CSS classes in your custom stylesheet.

Combining formatting

Mix multiple formatting styles:

```
**Bold and ==highlighted== text**

*Italic and ~subscript~ text*

`Code with ^superscript^`

[Link with **bold** text](https://example.com)
```

Bold and highlighted text

Italic and subscript text

Code with ^{superscript}

Link with **bold text**

Mathematical notation

For complex math, use the built-in KaTeX support:

```
$$
E = mc^2
```

\$\$

\$\$

$\sum_{i=1}^n x_i = x_1 + x_2 + \cdots + x_n$

\$\$

$$E = mc^2$$

$$\sum_{i=1}^n x_i = x_1 + x_2 + \cdots + x_n$$

See [Code blocks](#) for more on math blocks.

Best practices

- Use **highlighting** sparingly — overuse makes it meaningless
 - Prefer `==highlight==` over raw `<mark>` tags for portability
 - Use subscript/superscript for actual mathematical/chemical notation, not styling
 - Keyboard keys are great for tutorials, quick starts, and user guides
 - Critic markup is useful for collaborative editing and changelogs
 - Don't nest too many formatting styles — it becomes hard to read
 - Test how special characters render in search results
-
