

Images

DocsForge handles images with enhanced styling options. Images are responsive by default and support lazy loading, alignment, sizing, and more.

Basic image

Standard Markdown syntax:

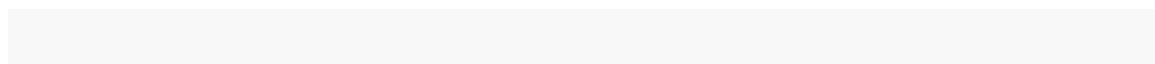

```
! [Alt text] (../assets/images/screenshot.svg)
```

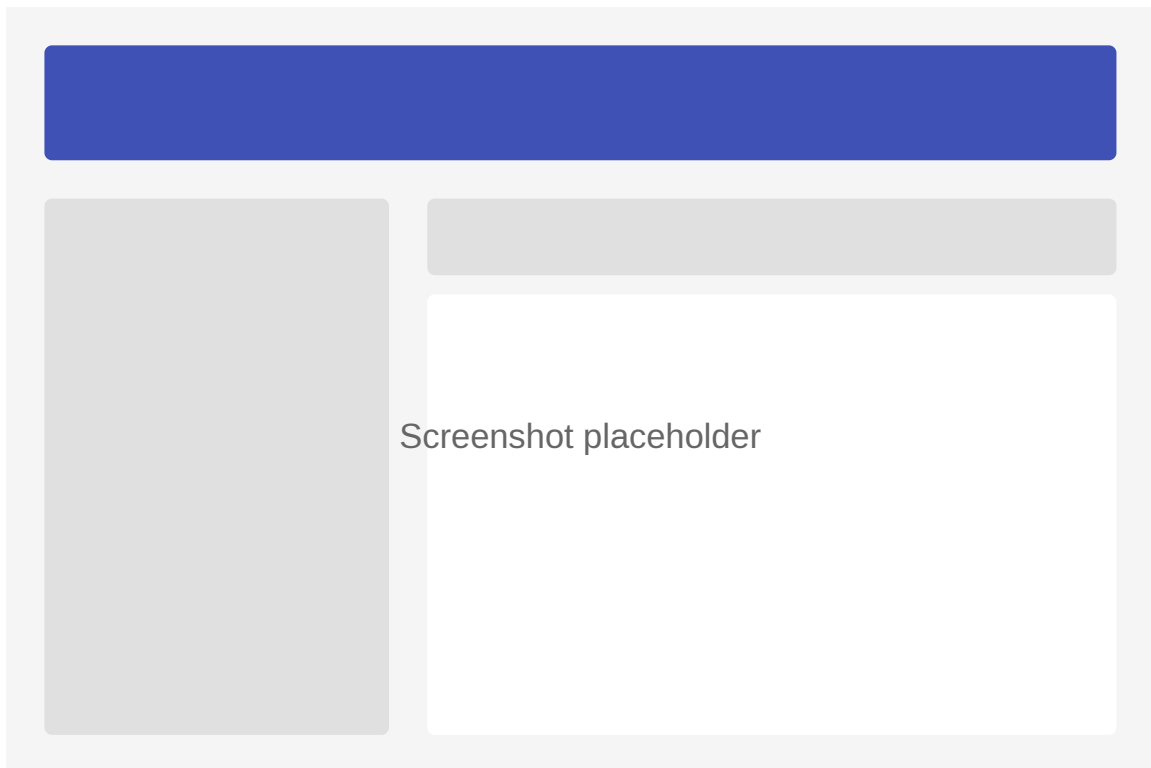

Always use descriptive alt text for accessibility and SEO.

Image with caption

Use `figure` markup for captions:

```
<figure markdown="span">
  ![Screenshot](../assets/images/screenshot.svg)
  <figcaption>Documentation site preview</figcaption>
</figure>
```

Documentation site preview

Image alignment

Left aligned

```
![Image](../assets/images/screenshot.svg){ align=left }
```

Text wraps around the image on the right.

Right aligned

```
! [Image](../assets/images/screenshot.svg){ align=right }
```

Text wraps around the image on the left.

Center aligned

```
! [Image](../assets/images/screenshot.svg){ align=center }
```

Image is centered with text above and below.

Image size

Set width and height:

```
! [Image](../assets/images/screenshot.svg){ width="300" }
```

Set width as a percentage:

```
! [Image](../assets/images/screenshot.svg){ width="50%" }
```

Set both width and height:

```
! [Image](../assets/images/screenshot.svg){ width="300" height="200" }
```

Aspect ratio

Setting both width and height may distort the image. Use `width` alone to maintain aspect ratio.

Lazy loading

Images load lazily by default. To disable for above-the-fold images (like hero banners):

```
! [Hero image](assets/images/hero.png){ loading=eager }
```

Value	Behavior
<code>lazy</code> (default)	Load when image enters viewport

Value	Behavior
<code>eager</code>	Load immediately with page

Shadow effect

Add a subtle shadow for depth:

```
! [Image](../assets/images/screenshot.svg){ .shadow }
```

This works well for screenshots and UI mockups to separate them from the page background.

Linking images

Make an image a link:

```
[![Alt text](../assets/images/screenshot.svg)](https://example.com)
```

Open in new tab:

```
[![Alt text](../assets/images/screenshot.svg)](https://example.com){  
target="_blank" }
```

Lightbox (click to enlarge)

DocsForge supports lightbox mode for images. Click any image to see it full size:

```
! [Diagram](assets/images/diagram.png){ data-lightbox }
```

This is enabled automatically for most images. No configuration needed.

Image gallery

Create a grid of images:

```
<div class="grid" markdown>

![[Image 1]](assets/images/1.png)
![[Image 2]](assets/images/2.png)
![[Image 3]](assets/images/3.png)

</div>
```

Responsive images

DocsForge automatically makes images responsive. They:

- Scale to fit their container
- Never overflow the content area
- Maintain aspect ratio
- Work on all screen sizes

No configuration needed.

Image formats

Recommended formats:

Format	Best for	Size
SVG	Logos, icons, diagrams	Smallest, infinite scale
WebP	Screenshots, photos	~25% smaller than PNG/JPEG
PNG	Screenshots with transparency	Lossless, larger
JPEG	Photos without transparency	Good compression

Convert to WebP

```
# Using cwebp
cwebp -q 85 image.png -o image.webp

# Using ImageMagick
convert image.png -quality 85 image.webp
```

Optimization tips

- 1. **Use WebP when possible** — smaller than PNG/JPEG with similar quality
- 2. **Compress images** before adding to docs (use tinypng.com, ImageMagick, or ffmpeg)
- 3. **Use SVG** for logos, icons, and simple diagrams
- 4. **Keep under 200KB** when possible — larger images slow page load
- 5. **Use descriptive alt text** — important for accessibility and SEO
- 6. **Lazy load by default** — only use `eager` for above-the-fold images
- 7. **Consider dark mode** — use transparent PNGs or SVGs for dark theme compatibility

Image sizing guidelines

Type	Recommended size	Format
Logo	200×50px	SVG
Screenshot	800-1200px wide	WebP/PNG
Diagram	Vector	SVG
Icon	24×24px	SVG
Hero banner	1200×400px	WebP/JPEG
