

Changing the fonts

DocsForge supports Google Fonts out of the box. Configure fonts in `docsforge.yml` under the `theme.font` key.

Configuration

Google Fonts

```
theme:
  font:
    text: Roboto
    code: Roboto Mono
```

Supported font weights

DocsForge loads regular (400) and bold (700) weights automatically. For font families that need different weight names:

```
theme:
  font:
    text: "Open Sans" # Quotes needed for multi-word names
    code: "Fira Code"
```

Disabling font loading

If you want to use system fonts or load fonts yourself:

```
theme:
  font: false
```

Recommended font pairings

Roboto + Roboto Mono

The default pairing. Clean, modern, excellent for technical docs.

Inter + JetBrains Mono

Inter is optimized for screen readability. JetBrains Mono has ligatures and clear distinction between similar characters.

Open Sans + Source Code Pro

Friendly and approachable. Great for community-oriented projects.

Lato + Fira Code

Warm and professional. Fira Code adds programming ligatures.

Custom fonts

To use fonts not available on Google Fonts, load them via custom CSS:

```
extra_css:  
  - assets/stylesheets/custom.css
```

docs/assets/stylesheets/custom.css

```
@font-face {  
  font-family: "My Font";  
  src: url("../fonts/my-font.woff2") format("woff2");  
  font-weight: 400;  
}  
  
:root {  
  --md-text-font: "My Font";  
}
```

Place your font files in `docs/assets/fonts/`.
