

Changing the language

Set the site language in `docsforge.yml`. This affects search stemming, typography (e.g., Chinese justification), and RTL layout.

Configuration

```
extra:
  alternate:
    - name: English
      link: /
      lang: en
    - name: 中文
      link: /zh/
      lang: zh
```

Or for a single language site, the language is primarily configured via the theme:

```
theme:
  language: en
```

Supported languages

DocsForge (via the Material theme) supports 60+ languages:

- `en` — English
- `zh` — Chinese (Simplified)
- `zh-Hant` — Chinese (Traditional)
- `ja` — Japanese
- `ko` — Korean
- `de` — German
- `fr` — French
- `es` — Spanish
- `pt` — Portuguese
- `pt-BR` — Portuguese (Brazil)
- `it` — Italian
- `ru` — Russian

- `ar` — Arabic
- `hi` — Hindi
- And 50+ more

Search language

Search stemming is language-aware. The search plugin automatically uses the configured language:

```
plugins:
  - search:
      lang:
        - en
        - de
```

Multiple languages can be specified for multilingual search.

Right-to-left (RTL) support

For Arabic, Hebrew, and other RTL languages, DocsForge automatically adjusts layout direction when the language is set:

```
theme:
  language: ar
```

Custom translations

You can override individual translation strings through the theme's localization files, or create a custom translation file in `docs/locales/xx/LC_MESSAGES/messages.po` and reference it from your overrides.
