

Setting up site search

DocsForge includes a powerful client-side search engine. It's enabled by default via the `search` plugin.

Configuration

Basic setup

Search is enabled by default:

```
plugins:
  - search
```

Search separator

Control how search terms are split into tokens:

```
plugins:
  - search:
      separator: '[\s\u200b\-\_,:!=\[\]()"\`\/]+|\.(?!\\d)|&[lg]t;|(?!\b)(?=[A-Z][a-z])'
```

The default separator splits on:

- Whitespace and zero-width spaces
- Hyphens, underscores, commas, colons
- CamelCase boundaries (e.g., `MyClass` → `My + Class`)

Language

Configure search stemming for your language:

```
plugins:
  - search:
      lang: en
```

Supported languages include: en, de, es, fr, ja, pt, ru, zh.

Search features

Enable in `theme.features`:

Highlighting

Highlight matching terms in search results:

```
theme:
  features:
    - search.highlight
```

Suggestions

Show autocomplete suggestions as you type:

```
theme:
  features:
    - search.suggest
```

Share search

Allow users to share direct links to search results:

```
theme:
  features:
    - search.share
```

Complete search configuration

```
theme:  
  features:  
    - search.highlight  
    - search.suggest  
    - search.share  
  
plugins:  
  - search:  
      separator: '[\s\u200b\-_, :!=\\[\]()\"`\/]+|\\. (?!\\d) |&[lg]t;|(?!\\b)(?=[A-Z][a-z]))'  
      lang: en
```

Search behavior

- **Instant:** Results appear as you type, with no server round-trip
- **Fuzzy matching:** Minor typos are tolerated

- **Stemming:** Searching for "run" finds "running", "runs", etc.
- **Ranking:** Results ordered by relevance (title matches rank higher)
- **Excerpts:** Each result shows a snippet with context

Excluding content from search

Add `search.exclude` front matter to hide a page:

```
---  
search:  
  exclude: true  
---
```

Or exclude specific sections with HTML comments:

```
<!--search exclude-->  
This content will not be indexed.  
<!--end search exclude-->
```
